

- 1 (d) Neither HCl nor H_2O in their pure states

Explanation:

An azeotropic mixture distils without change in composition, so its components cannot be completely separated by simple distillation.

- 2 (c) Shows positive deviation from Raoult's law

Explanation:

Positive deviation increases vapour pressure and lowers boiling point, forming minimum boiling azeotropes.

- 3 (d) Azeotropic liquid mixture

- 4 (a) Constant temperature boiling mixtures

- 5 (b) Azeotropic mixture
