

Colligative properties

- The magnitude of colligative properties in all colloidal dispersions isthan solution
(a) Lower (b) Higher
(c) Both (d) None
- Equimolar solutions in the same solvent have
(a) Same boiling point but different freezing point
(b) Same freezing point but different boiling point
(c) Same boiling and same freezing points
(d) Different boiling and different freezing points
- Which of the following is a colligative property
(a) Osmotic pressure
(b) Boiling point
(c) Vapour pressure
(d) Freezing point
- The colligative properties of a solution depend on
(a) Nature of solute particles present in it
(b) Nature of solvent used
(c) Number of solute particles present in it
(d) Number of moles of solvent only
- Which of the following is not a colligative property
(a) Osmotic pressure
(b) Elevation in B.P.
(c) Vapour pressure
(d) Depression in freezing point
- Which of the following is not a colligative property
(a) Optical activity
(b) Elevation in boiling point
(c) Osmotic pressure
(d) Lowering of vapour pressure
- Colligative properties of a solution depends upon
(a) Nature of both solvent and solute
(b) The relative number of solute and solvent particles
(c) Nature of solute only
(d) Nature of solvent only
- Which is not a colligative property
(a) Refractive index
(b) Lowering of vapour pressure
(c) Depression of freezing point
(d) Elevation of boiling point
- Which of the following is a colligative property

- (a) Surface tension
 - (b) Viscosity
 - (c) Osmotic pressure
 - (d) Optical rotation
10. Colligative properties are used for the determination of
- (a) Molar Mass
 - (b) Equivalent weight
 - (c) Arrangement of molecules
 - (d) Melting point and boiling point
 - (d) Both (a) and (b)
11. What does not change on changing temperature
- (a) Mole fraction
 - (b) Normality
 - (c) Molality
 - (d) None of these
